Faulted systems (except for 3-phase faults) are not symmetrical systems, so it would appear that symmetric component is not much good for asymmetrical faults. • Practical way – Replace the fault with an unbalanced source, then the network becomes symmetric.

The fault analysis of a power system is needed in order to provide information for the choice of switch-gear, size of conductors, setting of relays, finding the rating requirements of other power equipment and confirming system stability. All the equipment must be chosen to work with the fault current that

power system disturbance analysis function and its implementation. The book then guides readers through the causes and modes of clearing of phase and ground faults occurring within power systems as well as power system phenomena and their impact on relay system performance.
