Genetic engineering - Wikipedia

Genetic Engineering Steps. Gene of interest is isolated. Transfer vector is inserted into the genes. The vector is transferred into the organism that is to be modified. The cells of an organism are transformed. Genetically modified organisms (GMO) are selected and separated from those that could not be modified.

Genetically modified food, crops and GMO issues. Read current science articles on genetic engineering including mice with glowing hearts, disease-resistant mosquitos, GM bacteria chips and more.

GEN - Genetic Engineering and Biotechnology News

Genetic engineering is the process of manipulating an organism's genome using biotechnology and the products of it are either referred to as "genetically modified" or "transgenic" organisms. Check out the disadvantages of genetically modified foods here.

Journal of Genetic Engineering and Biotechnology ...

Genetic engineering, also called genetic modification or genetic manipulation, is the direct manipulation of an organism's genes using biotechnology. It is a set of technologies used to change the genetic makeup of cells, including the transfer of genes within and across species boundaries to produce improved or novel organisms. New DNA is obtained by either isolating and copying the genetic material of interest using recombinant DNA methods or by artificially synthesising the DNA. A construct i
